

## **MOTAN COLORTRONIC LIMITED PRESS RELEASE**

---

---

### **IntelliFlow**

The problem of 'angel hair' (flat strings of material created during a normal conveying mode) has been virtually eliminated with the bonus of energy saving and noise reduction with the Motan Colortronic IntelliFlow system.

By controlling the velocity of the material flow to each hopper loader, which is optimised taking into account the distances involved, angel hair can be reduced or totally eliminated.

"The reduction of the required energy of up to 50% and noise reduction of over 2 dBA measured during development tests are benefits not to be ignored in today's competitive market " states Karl Miller of Motan Colortronic Limited.

Several recent installations in the UK have generated positive feedback from customers and a system is available at Chesterfield for live viewing or testing of customer specific materials.
