
MOTAN COLORTRONIC LIMITED PRESS RELEASE

Intelliblend Technology

“Since its introduction in the 1980’s the gravimetric batch blender ‘GraviColor’ has become a popular unit in the plastics industry” states Karl Miller of Motan Colortronic Limited.

The initial popularity was mainly due to the cost advantage over many volumetric units and the labour savings due to the fact the units are self calibrating.

Since then the GraviColor range has been optimised to produce a compact, extremely accurate and easy to use control with smooth integration to the Ethernet network.

The ‘Intelliblend’ software ensures the individual materials that are dosed are compensated for bulk density variations at all times.

The Gravinet easy to use touch screen can be networked and operated with a local operating unit with a web panel or central PC where all important parameters can be viewed and logged.

The units also have an option of integrated conveying control for a complete, easy to use solution.

The units are available for testing by the customer at the Chesterfield Tech Centre.
